

Anonymized Work Sample

Repository names, branch names, local overlay filenames, and feature-specific labels have been generalized.

Handoff / Continuity Summary

Delivered Behavior

- added notification handling to the external custom module
- recorded pending notification state when a new imported taxonomy term is created
- used imported description data when present
- marked pending terms ready after queued content saves completed
- sent the notification from the second processing pass
- added application log entries for success and failure
- added configurable notification settings to the admin form
- updated config defaults and schema for the new settings

Delivery Wiring

- pushed module changes to an external custom module repository branch
- updated the site dependency to install that delivered branch locally
- refreshed the lockfile so the site resolves the delivered branch

Local Validation Support

- added a reversible local mail-catcher setup
- kept the local settings override separate from shipped runtime
- used a reduced import fixture to make repeated validation faster

Important Notes

- the main site repo is not the authoritative code location for the module changes
- browser-triggered processing hit local timeout limits, so CLI validation was used
- local mail-catcher testing exposed recipient-handling differences that shaped the delivery adjustments

Remaining Follow-Up Risk

- automated test coverage is still missing
 - expanded multi-item validation should be re-run if the feature is extended
 - customer transport validation remains separate from local development testing
-

This public sample preserves continuity and handoff structure while removing private repo, branch, and local environment details.

Anonymized Work Sample — Client names, domains, repositories, paths, and private references have been removed or generalized.
